Education

B.Tech – Computer Science & Engineering *2022 – 2026*
SRM Institute of Science and Technology, Kattankulathur *CGPA: 9.64 / 10.0*

Experience

Software Engineering Intern — Ramco Systems *Jan 2026 – Mar 2026*

- Built and maintained RESTful APIs integrated with frontend ERP modules in an Agile/Scrum environment, ensuring data integrity and correctness across interdependent business logic layers.
- Designed a local API mocking layer that decoupled frontend development from live server dependency, enabling parallel team testing without disrupting the production pipeline.
- Participated in code reviews focused on secure coding practices, input validation, and backend reliability under concurrent requests.

Projects

SOC Triage — AI-Powered Alert Analysis Platform *2026*
github.com/Sa10Lynx/soc-triage · Live: soc-triage-client.vercel.app

- Built a full-stack SOC analyst tool that ingests raw SIEM/EDR alerts (syslog, JSON, CEF/LEEF, Windows Event Log) and generates structured triage reports — severity classification, MITRE ATT&CK mapping, and IOC extraction — addressing the alert-fatigue problem in enterprise SOCs handling 4,000+ alerts/day.
- Designed a constrained-JSON prompting architecture against the Claude API so every model response is validated against a fixed schema before it reaches the UI, covering all 14 MITRE ATT&CK tactics with confidence-scored mapping and false-positive likelihood assessment.
- Implemented an investigation-checklist generator and one-click IOC extraction (IPs, domains, hashes, usernames); deployed full stack — React/Vite on Vercel, Node.js/Express on Railway.

CryptSCA — Secure Group Chat Platform *2024*
github.com/Sa10Lynx/Crypt_SCA · Live: crypt-sca.vercel.app

- Engineered end-to-end encrypted group messaging (AES-256-GCM, PBKDF2 key derivation) performed client-side via the Web Crypto API, with room-based access control and server-side session validation (Node.js/Socket.io); messages are never stored — ephemeral by design.

Research

Lightweight ML-Based DoS Detection for Resource-Constrained IoT Devices *2025 – 2026*
github.com/Sa10Lynx/Iot_DOS · B.Tech Final Year Project

- Designed an intrusion-detection pipeline on the UNSW-NB15 dataset (18 engineered network-flow features); benchmarked LightGBM, Random Forest, and SVM — LightGBM reached 99.3% detection accuracy at sub-10ms inference latency for real-time edge deployment.

Technical Skills

Languages	Python, JavaScript, Java, C++, SQL
Development	React, Node.js, Socket.io, REST APIs, Git, Linux, Docker (basics), Vercel, Railway
Security	Threat Analysis, Vulnerability Research, Anomaly Detection, MITRE ATT&CK, EDR/SIEM Concepts, Cryptography (AES-256-GCM, PBKDF2), Secure Coding
Networking	TCP/IP, HTTP/S, DNS, WebRTC, Network Protocol Analysis

Certifications & Activities

- Google Cybersecurity Certificate (Coursera, 2024) — Foundations of Cybersecurity, Network Security, Linux & SQL
- NPTEL Certifications — Computer Networks, Computer Architecture, Java
- Cisco Networking Fundamentals
- Active in cybersecurity CTFs and security research labs covering log analysis, threat detection, and network forensics
